

## High resolution LED modules

**High resolution LED systems guarantee razor sharp image reproduction. Our equipment is selected to perfectly suit the occasion and the content of each event. The goal: realistic colour rendering and high resolution image quality even at short viewing distances.**

Media productions in locations can be realised without limitations.

Our modular LED systems can be used for high resolution images on flat surfaces as well as for concave, convex, circular and oval installations.

„Pixel pitch“ is the term for the distance between the dots on a screen. The shorter the distance, the higher the potential image resolution. The LED systems in our latest equipment enable viewing distances as short as three metres. As a result, LED walls can now also be used at smaller corporate events or trade fairs at which we previously worked with seamless displays. LED systems really come into their own in rooms with a lot of ambient light, as projectors are not able to deliver optimum results in such conditions. The modules are cooled without the use of fans and are therefore extremely quiet. What is more, energy consumption and heat radiation are kept at comparatively low levels.

**Special features:**

- Lightweight construction
- Slim design
- Extremely quiet thanks to fanless cooling
- Convex, concave, circular and oval setup possible, standing or suspended
- Low power consumption
- Low heat generation
- Test for electromagnetic compatibility (EMC)
