next-level conferencing

come2interact – next-level conferencing

Would you like to have an active, involved audience? Do you want feedback from your conference participants, live statements, discussion or even instant voting? N&M has developed an interactive solution that addresses such needs:

come2interact – our application specifically designed to meet the requirements of the congress and meeting sector.

With **come2interact**, your plenary participants can use iPads provided by us or their own smartphones (BYOD) to direct questions to the podium, comment on presentations, keep an eye on the agenda and lots more. If you wish, live comments can even be sent straight to video walls.

come2interact will make your conference interactive and lively – with state-of-the-art technology. We have gathered over 30 years of experience in the technical realisation of congresses and conferences and have channelled it into this application.

The come2interact screen design will be adapted, to match your corporate design.

One key point in ensuring the smooth running of your event is that with come2interact control of the interaction with your attendees is always in your hands.

come2interact – the icing on the cake in N&M's range of event technology products to complete the company's all-round service for your conference or congress.

come2interact features five basic functions that will help you to activate the full potential of your auditorium in the interests of your cause:

- **Vote!** – have your plenary participants vote live on your proposals
 - For/against, yes/no and multiple choice
 - Results on video wall in real-time
- **Ask!** – feed your moderator with relevant questions straight from the audience
 - All questions are collected and pre-structured in a pool in the control centre
 - From here they can be sent straight to the projection screen or only to the moderator
- **Brainstorm!** – collect creative ideas from your auditorium
 - The suggestions generated in this way can be shown on video walls in real-time, as an „idea cloud“ for example.
 - Live weighting with a „like“ function
- **Agenda!** – keep your conference participants up to date
 - Info on agendas, participants, rooms...
- **Map!** – show your attendees the available rooms and where they are located
